

My name is Stefan Rusu and I am a second year trainee in Pathology in Brussels, Belgium. My main motivation for attending the Molecular Pathology Study day was to understand why, when and for whom requesting molecular analysis. In my day-to-day practice, molecular tests are frequently executed for patients, but, as a trainee, it is not always clear why asking them. These lectures allowed me to understand the necessity of testing in each field and to structure my knowledge.

Even if the lectures were dense in content, I was able to follow and understand them and the possibility of going back to lectures when you have a doubt, helps. We perform a lot of molecular analysis in our current practice, but with the acquired knowledge after attending the virtual study day, I am able to understand better the results and the importance of molecular testing. The Study Day met entirely my expectations and I would recommend it to other trainees with no hesitation.

Best wishes,

Stefan Rusu, M.D.

My name is Stefan Rusu and I am a second year trainee in Pathology in Brussels, Belgium. My main motivation for attending the Cut-Up Study day was to improve my knowledge and skills. Furthermore, I have not faced several specimens yet in my formation, so I considered that having some theoretical fundamentals might help me in my practice.

Attending the study day made me feel more confident in sampling specimens and filled some theoretical gaps. Many of the presented techniques have been already implemented in the department where I am working. The online experience and the care to details and feeling involved met my expectations and I would recommend the study day to my colleagues, especially to the trainees at the beginning of their career.

Best wishes,

Stefan Rusu, M.D.
