uicc global cancer control

TNM-7
Oesophagogastric junction tumours

A tumour the epicenter of which is within 5 cm of the esophagogastric junction and also extends into the oesophagus is classified and staged according to the **oesophageal** scheme

All other tumours with an epicenter in the stomach greater than 5 cm from the oesophagogastric junction or those within 5 cm of the EGJ *without* extension into the oesophagus are staged using the **gastric** carcinoma scheme

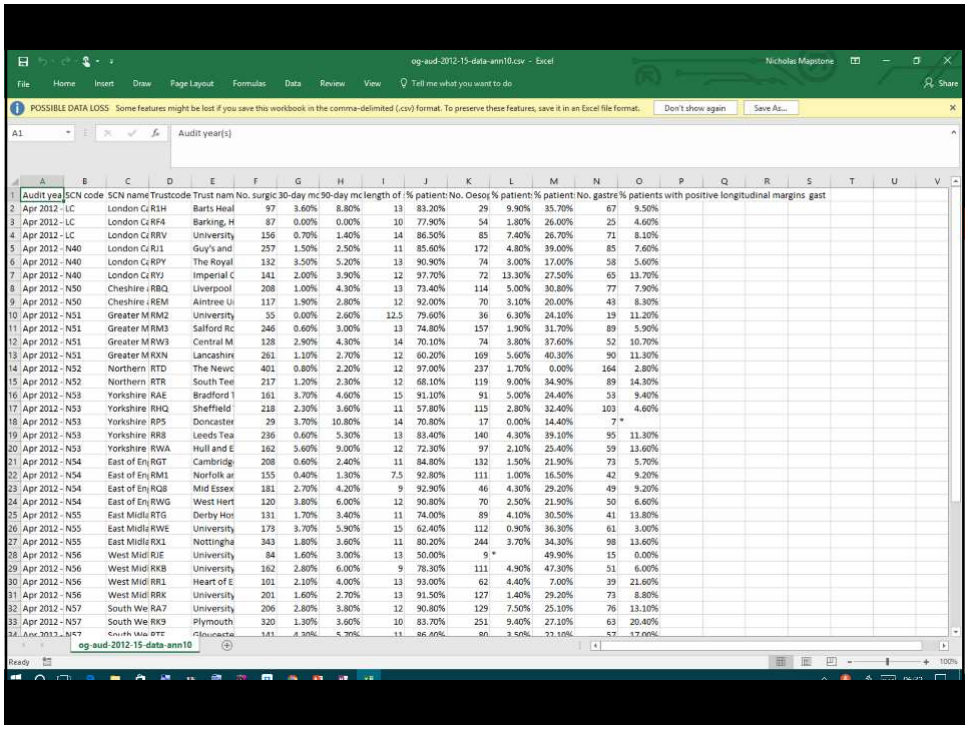
Percentage of patients with positive resection margins after a curative resection, in England and Wales

	Oesophagectomy		Gastrectomy		Total	
	n	Overall %	n	Overall %	n	Overall %
Positive longitudinal (proximal or distal) resection margin	98	3.7	144	9.1	242	5.7
Positive circumferential margin	685	27.7	113	10.5	798	22.5



NOGCA 2016

Number of lymph nodes examined and positive resection margins

Annex 10 reports the metrics reported in England for the Clinical outcomes publication (COP) 2016 (volume, 30-day mortality, 90-day mortality) for both England and Wales, as well as the proportion of patients with adequate lymph nodes examined and proportion of patients with positive margins at the trust/health board level.

Guidelines suggest that the minimum number of lymph nodes required for staging the disease is at least 15 for both oesophagectomies and gastrectomies. Adequate lymph node resection enables more accurate staging, which may offer a survival benefit. This indicator will allow the surgical units to monitor their process of care and adherence to published standards of surgical care. We provide some initial figures on the number of lymph nodes examined, and will be undertaking further development work next year. This will focus on clarifying the most appropriate definition of the measure and the creation of a risk adjustment algorithm with adequate performance.

Lee 2015

How to Define a Positive Circumferential Resection Margin in T3 Adenocarcinoma of the Esophagus

Roy J.J. Verhage, MD, Herman J.A. Zandvoort, MD,* Fiebo J.W. ten Kate, MD, PhD,† and Richard van Hillegersberg, MD, PhD**

Abstract: A positive circumferential resection margin (CRM+) prevalence of obesity and reflux disease, esophageal adeno-carcinoma (EAC) has become the most prevalent type

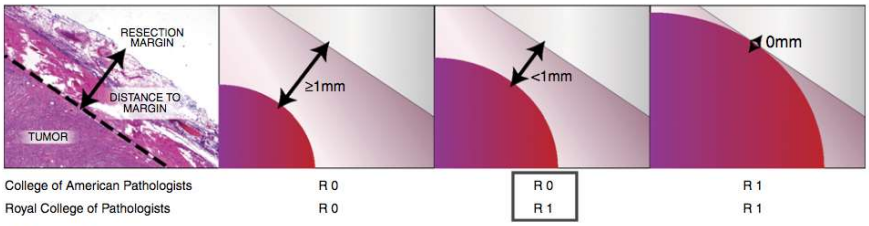

FIGURE 1. Definitions of the CRM according to the criteria of the CAP and the RCP. The corresponding R-classification is denoted; R0-no microscopic residual tumor; R1-microscopic residual tumor; R2-macroscopic residual tumor (not shown). EAC, Hematoxylin and eosin staining.

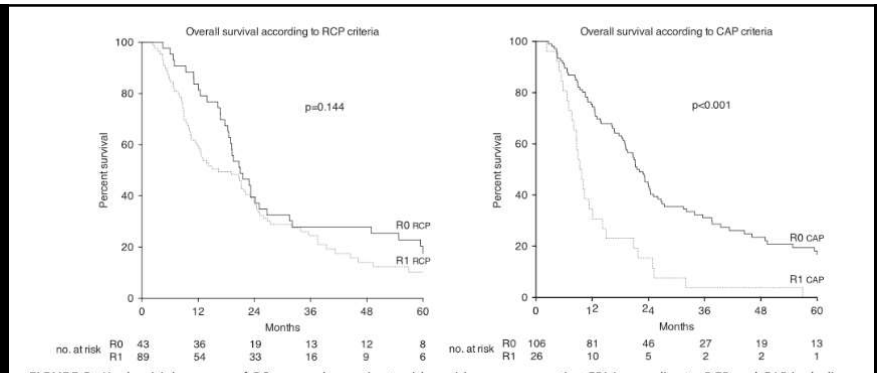

FIGURE 2. Kaplan-Meier curves of OS comparing patients with positive versus negative CRM according to RCP and CAP including log rank *P* value and numbers at risk.

Inclusion and Exclusion Criteria

As prognosis is highly influenced by disease stage and CRM involvement predominantly concerns advanced disease,[10] only patients with T3 adenocarcinoma of the esophagus were included. Exclusion criteria were inhospital mortality and the use of neoadjuvant chemotherapy or chemoradiotherapy. These criteria were applied to yield a homogenous study population.

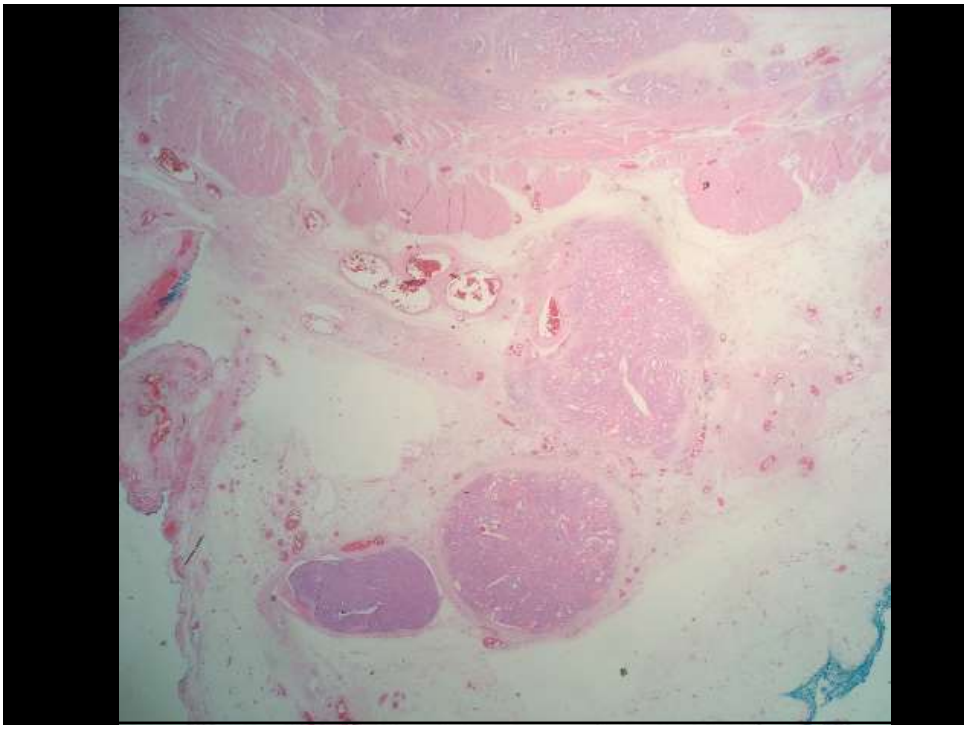
Thompson *et al.*[27] (2008)	Australia	RCP	240	NA	85 (35·4)	127 (52·9)	CRT	No	NA	8
Verhage *et al.*[19] (2011)	The Netherlands	CAP* and RCP	132	26 (19·7)	89 (67·4)	132 (100)	None	Yes	28·4	8

Values in parentheses are percentages. *Indicates the definition that was more prognostically significant in studies that used both definitions of circumferential resection margin (CRM) involvement. NO, Newcastle–Ottawa study quality score; CAP, College of American Pathologists (tumour at CRM); RCP, Royal College of Pathologists (tumour within 1 mm of CRM); CRT, neoadjuvant chemoradiotherapy; NA, data not available; CT, neoadjuvant chemotherapy.

Conclusion: CRM involvement is an important predictor of poor prognosis. CAP criteria differentiate a higher-risk group than RCP criteria, but overlook a patient group with similar poor outcomes.



According to the UICC TNM classification, 6 and 16 lymph nodes are the minimum number of lymph nodes that should be retrieved from an oesophagectomy specimen and gastrectomy specimen, respectively.

Tumour regression grade

System used:	grade:

Table 2: Published tumour regression scoring systems for oesophageal cancer

Authors	Grading	Pathological features
Mandard et al 1994 (177)		
	TRG1	Complete regression (i.e. fibrosis without detectable residual cancer cells)
	TRG2	Few residual cancer cells scattered through the fibrosis
	TRG3	Fibrosis and tumour cells with predominance of fibrosis
	TRG4	Residual cancer outgrowing fibrosis
	TRG5	Absence of any regressive changes
Japanese Society of Esophageal Disease (184)		
	ypV0	Ineffective (i.e. no regression evidence)
	ypV1	Slightly effective: Viable cell more than 1/3 of tumour tissue, but with evidence of degeneration
	ypV2	Moderately effective: Viable cell less than 1/3 of tumour tissue and severely degenerated or necrotic
	ypV3	Markedly effective: No viable cell
Schneider et al 2005 (185)		
	I	>50% vital residual tumour cells
	II	10%–50% vital residual tumour cells
	III	<10% vital residual tumour cells
	IV	no vital residual tumour cells
Chirieac et al 2005 (179)		
	1	No evidence of residual tumour
	2	1-10% residual tumour
	3	11-50% residual tumour
	4	>50% residual tumour
***Becker et al 2003 (178) Swisher et al 2005 (186) Langer et al (175)**		
	CRT	no residual cell
	P1	1%–50% of residual viable cell
	P2	>50% residual viable cell in primary tumour
Brucher et al 2006 (176) Barbour et al 2008 (187)		
	Responders	<10% residual tumour cells
	Non responders	>10% residual tumour cells
Donington et al 2003 (188)		
	Complete responders	No evidence of residual tumour
	Residual tumour	Any evidence of residual tumour

*Becker et al original paper developed the system originally for gastric cancer and later used the same system for oesophageal cancer
