**WHO Classification of Tumours:
Tumours of the Urothelial Tract
Differences between the 3rd and 4th editions**

Third edition: urothelial tumours

Infiltrating urothelial carcinoma
with squamous differentiation
with glandular differentiation
with trophoblastic differentiation

Nested

Microcystic

Micropapillary

Lymphoepithelioma-like

Lymphoma-like

Plasmacytoid

Sarcomatoid

Giant cell

Undifferentiated

Fourth edition: urothelial tumours*

Infiltrating urothelial carcinoma
with divergent differentiation

Nested, including large nested

Microcystic

Micropapillary

Lymphoepithelioma-like

Plasmacytoid/signet ring cell/diffuse

Sarcomatoid

Giant cell

Poorly differentiated

Lipid rich

Clear cell

WHO Classification of Tumours:
Tumours of the Urothelial Tract
Differences between the 3rd and 4th editions

Third edition: urothelial tumours

Non-invasive urothelial neoplasias

Urothelial carcinoma in situ

Papillary urothelial carcinoma, low grade

Papillary urothelial carcinoma, high grade

Papillary urothelial neoplasm of low malignant potential

Urothelial papilloma

Inverted urothelial papilloma

Fourth edition: urothelial tumours*

Non-invasive urothelial neoplasias

Urothelial carcinoma in situ

Papillary urothelial carcinoma, low grade

Papillary urothelial carcinoma, high grade

Papillary urothelial neoplasm of low malignant potential

Urothelial papilloma

Inverted urothelial papilloma

Urothelial proliferation of uncertain malignant potential (hyperplasia)

Urothelial dysplasia/atypia

**WHO Classification of Tumours:
Tumours of the Urothelial Tract
Differences between the 3rd and 4th editions**

Fourth edition:

Urachal Carcinoma

Tumours of Müllerian-type

Clear cell carcinoma

Endometrioid carcinoma

Neuroendocrine tumours

Small cell neuroendocrine carcinoma

Large cell neuroendocrine carcinoma

Well differentiated neuroendocrine
carcinoma

Paraganglioma

Fourth edition:

Mesenchymal tumours

Inflammatory myofibroblastic tumour

Perivascular epitheloid cell tumour

Solitary fibrous tumour

Granular cell tumour

Miscellaneous tumours

Tumours of the upper urinary tract

Tumors arising in a diverticulum

Urothelial tumours of the urethra

WHO Classification of Tumours:
Tumours of the Urothelial Tract
an update on the forthcoming 4th edition

Outline

- Molecular taxonomy of urothelial neoplasia
 - Classification
 - Therapeutics
- Divergent differentiation in urothelial neoplasia
- Tumours of Müllerian type
- Grading of papillary urothelial tumors
- Substaging tumours invading the lamina propria

Comprehensive molecular characterization of urothelial carcinoma of the bladder

The Cancer Genome Atlas Research Network (n = 131)

Toward a Molecular Pathologic Classification of Urothelial Carcinoma

Sjödahl et al. *Am J Pathol* 2013

High rate of somatic mutations in bladder cancer

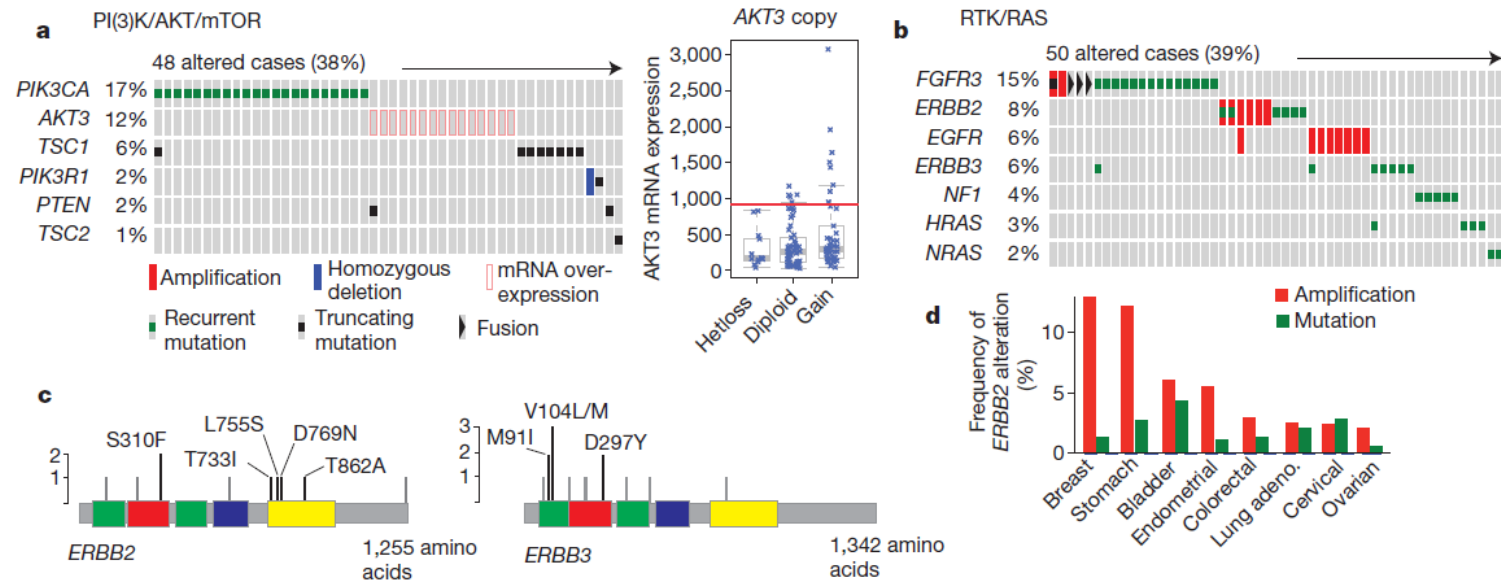

Frequency of somatic mutations in 27 tumor types (Lawrence M. Nature 2013)

Comprehensive molecular characterization of urothelial bladder carcinoma

Nature 2014

The Cancer Genome Atlas Research Network*

Targetable aberrations..

Neratinib study - any solid tumor with *HER2* mutations

Anti-Her2 immunotherapy (DN24-02)

RTOG 0524 trial (Her2)

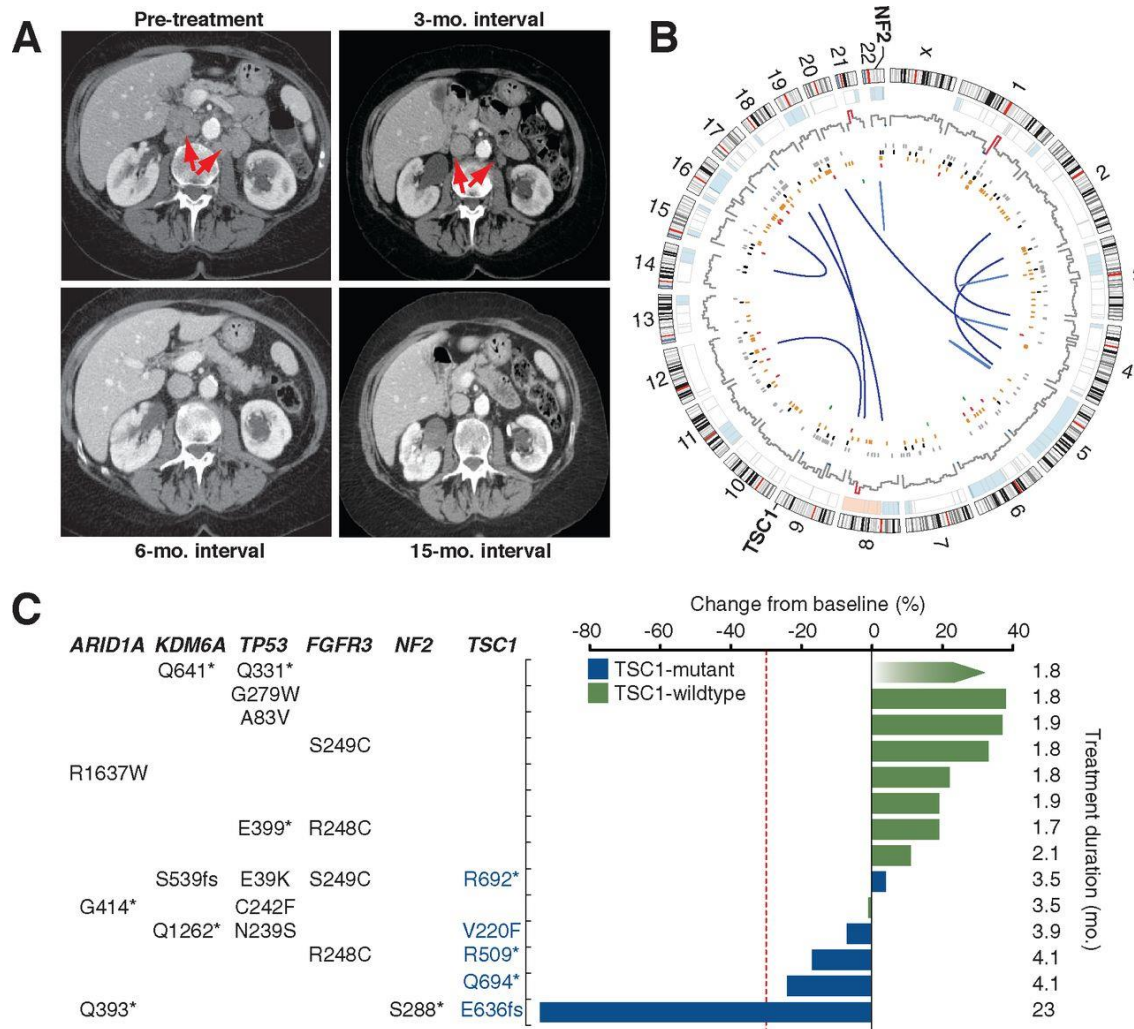

BKM10 trial for bladder cancer patients with alterations within the PI3K/Akt/mTOR pathway

Mocetinostat (histone deacetylase [HDAC] inhibitor) for UC with *CREBBP* and/or *EP300* alterations

Other potential targets: *FGFR3*, *EGFR*, *ERBB3*, etc..

Genome sequencing identifies a basis for everolimus sensitivity

Fig. 1 (A) Computed tomography images of the index patient demonstrating complete resolution of metastatic disease (arrows).

UROTHELIAL CARCINOMA WITH
SQUAMOUS DIFFERENTIATION

UROTHELIAL CARCINOMA WITH
GLANDULAR DIFFERENTIATION

CYSTECTOMY FOR BLADDER CARCINOMA

300 consecutive cases

Residual MP invasive disease	212
• Conventional UC	154 (73%)
• UC with DD	58 (27%)
– Squamous	37
– Glandular	14
– SMCL/NE	3
– Squamous, glandular	3
– SMCL/NE, squamous	1

Specific Survival by Histology (TCC vs Aberrant Differentiation)

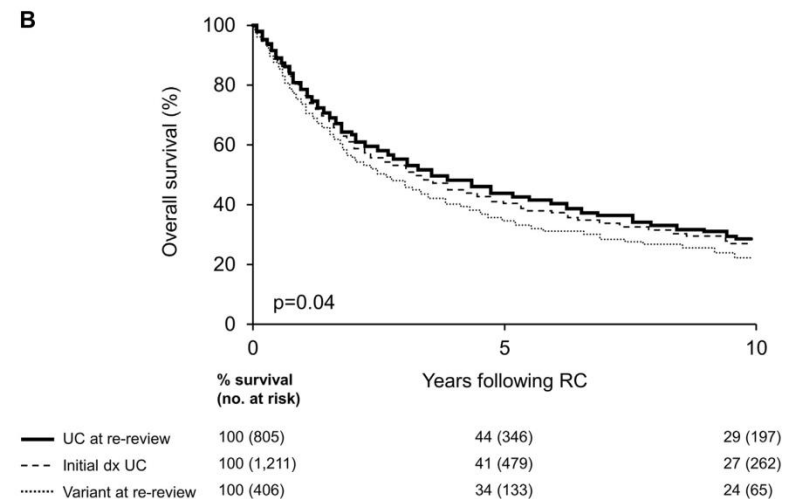

Reclassification after pathology re-review - radical cystectomy (n=1,211)

Mayo Clinic experience (Linder et al. *J Urol* 2013)

Histological UC subtypes identified at pathological re-review in 406 patients **(33% of entire cohort)**

	No. Variant UC (%)
Squamous differentiation	122 (30)
Micropapillary	62 (15)
Nested variant	51 (13)
Pure squamous Ca	39 (10)
Small cell Ca	36 (9)
Glandular differentiation	33 (8)
Adenoca	30 (7)
Sarcomatoid	14 (3)
Mixed differentiation	11 (3)
Inverted growth pattern	4 (1)
Plasmacytoid	1 (0.2)

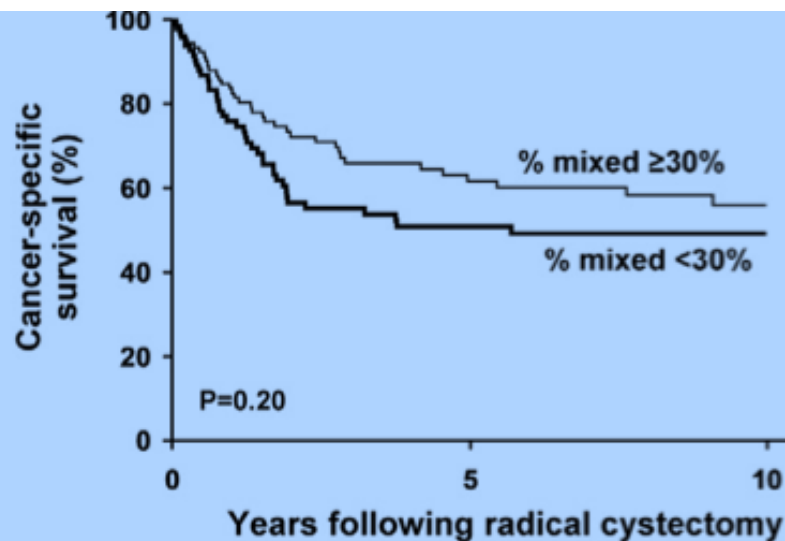

THE IMPACT OF OF SQUAMOUS AND GLANDULAR DIFFERENTIATION ON SURVIVAL AFTER RADICAL CYSTECTOMY FOR UROTHELIAL CARCINOMA

Kim SP et al, J Urol 2012;188:405-409

Group	% survival (no. at risk)	5	10
— Pure UC	100 (827)	57 (362)	51 (194)
— UC with differentiation	100 (186)	56 (71)	53 (36)

Figure 1. CSS after RC, stratified by pure UC in 827 patients vs UC with squamous and/or glandular differentiation in 186 in RC specimen.

Group	% survival (no. at risk)	5	10
— % mixed ≥30%	100 (99)	62 (41)	56 (19)
— % mixed <30%	100 (87)	51 (30)	49 (17)

Figure 2. CSS in 186 patients with squamous and/or glandular differentiation at RC, stratified by degree of histological differentiation in specimen. Median differentiation in this cohort was 30% (IQR 10, 60).

THE CLINICAL RELEVANCE OF VARIANT HISTOLOGY IN UROTHELIAL CARCINOMA AFTER RADICAL CYSTECTOMY

Soave A et al, Urol Oncol 2015;33:ePub

Non-squamous variant histology is associated with inferior survival but are not independent predictors of survival

Variant histology is associated with established predictors of aggressive tumor biology

Xylinas A et al, Eur J Cancer 2013;49:1889-1897

While variant UCB histology was associated with worse outcomes on univariate analysis, this effect did not remain significant on multivariable analyses

ADENOCARCINOMA

Mucinous
Papillary
NOS

“I would accept as primary at this site if direct extension or a metastasis from another organ has been ruled out clinically”

ADENOCARCINOMA OF THE URINARY BLADDER

Grignon et al

<u>Stage at Presentation</u>	<u>Cases(%)</u>	<u>Survival(%)</u>
pT1	2 (4)	100
pT2-pT3a	11 (20)	76
pT3b	12 (23)	28
pT4	24 (45)	20

Mucinous adenocarcinoma with signet ring cells

PLASMACYTOID UROTHELIAL CARCINOMA
(signet ring cell / diffuse)

Diffuse infiltrative growth
Non-gland/nest-forming
Plasmacytoid cells predominate
Variable # of signet ring cells
No extracellular mucin

Plasmacytoid urothelial carcinoma

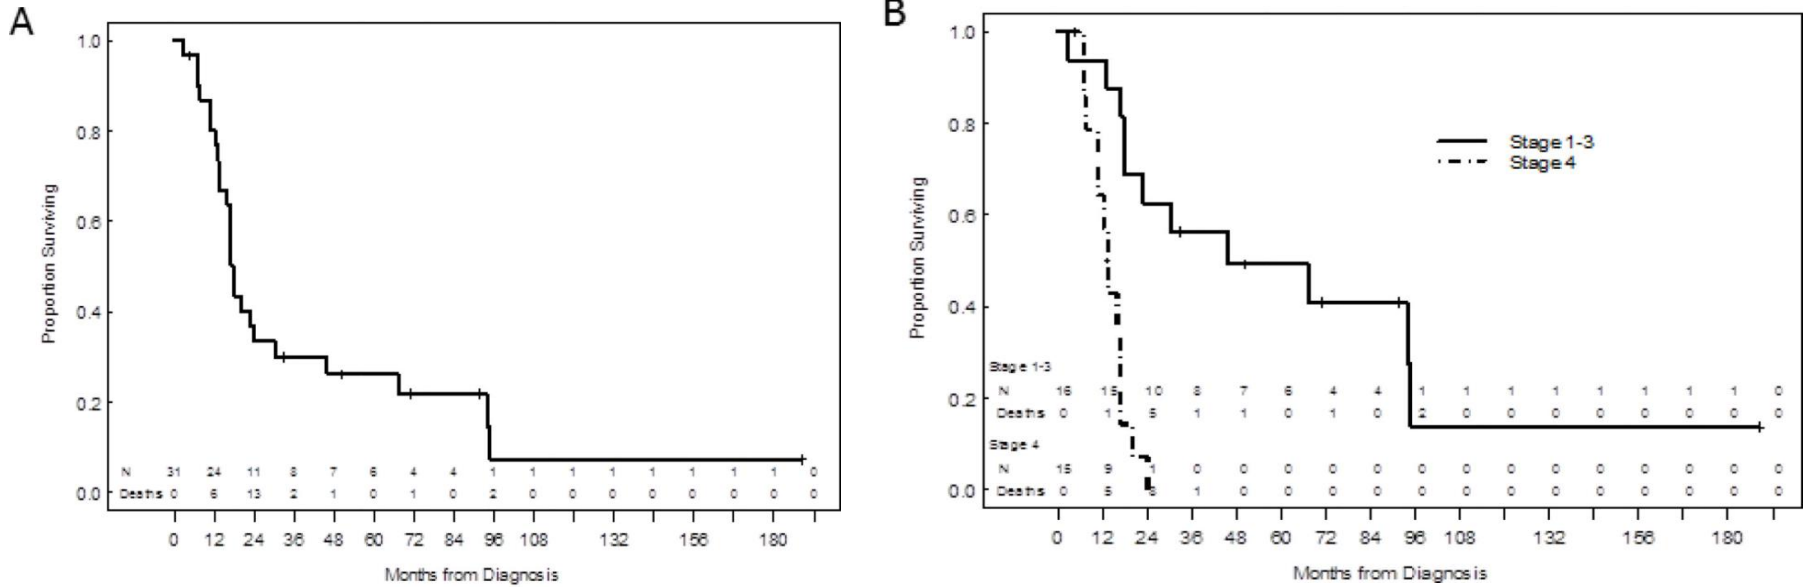

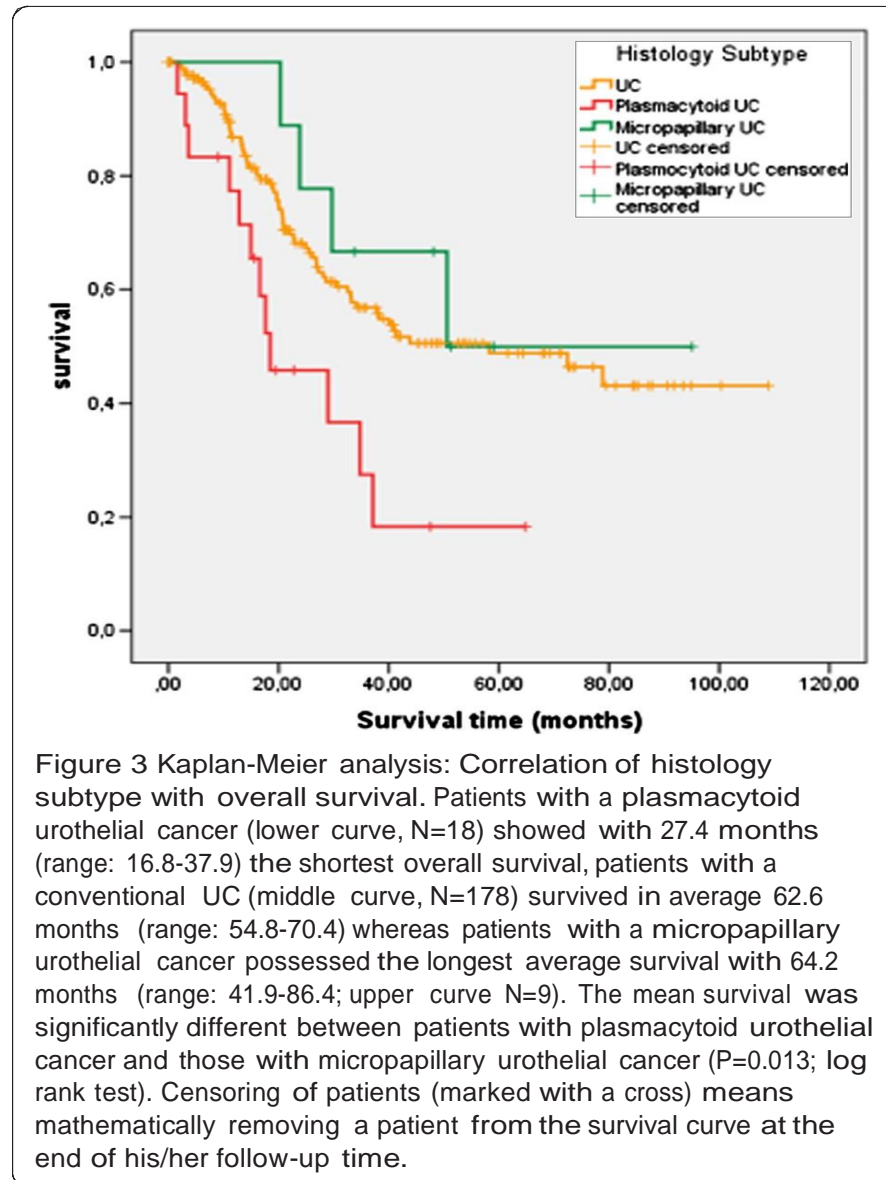

Figure 2.

(A) Overall survival (OS) for all patients (n=31) was 17.7 months. (B) OS by stage (I-III [45.8 months] vs. IV [13.4 months]; $P < 0.001$).

Plasmacytoid variant of bladder cancer defines patients with poor prognosis if treated with cystectomy and adjuvant cisplatin-based chemotherapy

Plasmacytoid/Signet Ring Cell Carcinoma of the Bladder

Inactivation of *CDH1* and loss of E-cadherin expression by IHC

All cases had loss of e-cadherin except:
1 tumor with splice site mutation and 1 tumor with missense mutation

E-cadherin

Müllerian-type tumours

- Arise from pre-existing Müllerian precursors within the bladder
 - Endometriosis, rarely Müllerianosis
- Tumour types*:
 - Clear cell carcinoma (F:M, 2:1)
 - Endometrioid carcinoma (only females)
- Histopathology – identical to those seen in the female genital tract

Clear cell carcinoma:

- Tubulocystic, papillary, diffuse
- Basophilic or eosinophilic secretions
- Tumour cells flat, cuboidal or columnar
- Hobnail cells common
- Nuclear enlargement and hyperchromasia
- Brisk mitotic activity

Immunohistochemistry

- PAX8, HNF β 1, CA-125, p53 positive and high Ki-67
- Endometrioid carcinoma express ER and PR

*Similar morphologies may be seen in urothelium-derived tumours

Clear Cell Carcinoma of the Urinary Bladder

Cases	13
M:F	2:11
Age	22-83 (57)
Endometriosis	2
Mullerian-type cysts	2

Oliva et al. AJSP 26:190,2002.

Clear cell carcinoma

Lipid rich

Clear cell (glycogen rich)

Nephrogenic adenoma vs clear cell adenocarcinoma

Clear cell carcinoma associated to Müllerian rests

Müllerian and mucinous metaplasia

p53

Clinical and Pathologic Factors Predicting Recurrence and High Risk in Superficial Bladder Cancer

Definition of High Risk:

- High grade Ta disease
- Diffuse carcinoma in situ
- Lamina propria invasion (T1) HG
- Multifocal recurrent superficial disease

Natural History of Superficial Bladder Cancer

176 cases (Ta and T₁) without adjuvant therapy followed for a least 20 years

- 80% experience recurrence
- 22% died of disease
 - 11% Ta
 - 30% T₁

Death from disease was related to:

Grade

of tumors

of recurrences

WHO/ISUP CLASSIFICATION OF UROTHELIAL TUMORS (2004 and 2010)

PAPILLARY NEOPLASMS

- Papilloma
- Inverted papilloma
- Papillary urothelial neoplasm of low malignant potential
- Papillary urothelial carcinoma, low grade
- Papillary urothelial carcinoma, high grade

Why should we commit to the ISUP/WHO classification?

Adoption of uniform terminology and definitions, based on cytological and architectural disorder

Establishment of detailed criteria for various preneoplastic conditions and tumor grades (AJSP 1998;22:1435-1448)

Elimination of the ambiguity in diagnostic categories in the WHO 1973 system (for example, carcinoma, grade I-II or carcinoma, grade II-III).

Synchronizing terminology with cytology, facilitating cyto-histologic correlation

Creation of a category of papillary neoplasm (PUNLMP) that has a negligible risk of progression although the potential for recurrence requires some level of clinical follow-up.

Defining a group of lesions (high grade) with a high risk of progression and which may be candidates for adjuvant therapy

Recommended by ISUP, WHO, ICCR

ASSESSMENT OF PAPILLARY UROTHELIAL NEOPLASMS

At medium magnification, the tumour pattern gives a predominant impression of:

ORDER

Of architectural and cytological features?

DISORDER

Of architectural and cytological features?

PUNLMP or Papillary Urothelial carcinoma, low grade

VARIATION

Of architectural and cytological features readily seen?

NO

YES

PUNLMP

Urothelial carcinoma, low grade

Urothelial carcinoma, high grade

PUNLMP

TABLE 5. Clinical status at last followup

	No. Papillary Neoplasms of Low Malignant Potential (%)	No. Low Grade Papillary Ca (%)	Total No. WHO I
Alive without bladder tumor*	75 (79)	91 (57)	166 (65)
Alive with bladder tumor†	3 (3)	16 (10)	19 (8)
Dead, no bladder tumor at last followup	14 (15)	31 (19)	45 (18)
Dead, with bladder tumor at last followup	1 (1)	10 (6)	11 (4)

Version 1.0, January 2006

GRADING OF PAPILLARY UROTHELIAL TUMORS

- Good interobserver concordance within a single institution ($\kappa = 0.5 - 0.65$)
- Fair to poor interobserver concordance globally

incidence of PUNLMP: 0-12%

PUNLMP vs LG

LG vs HG

- Absence of data* on the use of markers to grade lesions in a clinically significant manner

Table 1. Interobserver variability based on comparing 5 categories	Before biomarker evaluation	After biomarker evaluation
Free-marginal kappa	0.64	0.74
Complete agreement-6/6 pathologists	21/50 cases (42%)	25/45 cases (55%)
Majority agreement-4/6 pathologists	42/50 cases (84%)	42/45 cases (93%)

Combining molecular and pathologic data to prognosticate non-muscle-invasive bladder cancer

Bas W.G. van Rhijn

Urologic Oncology: Seminars and Original Investigations, Volume 30, Issue 4, 2012, 518–523

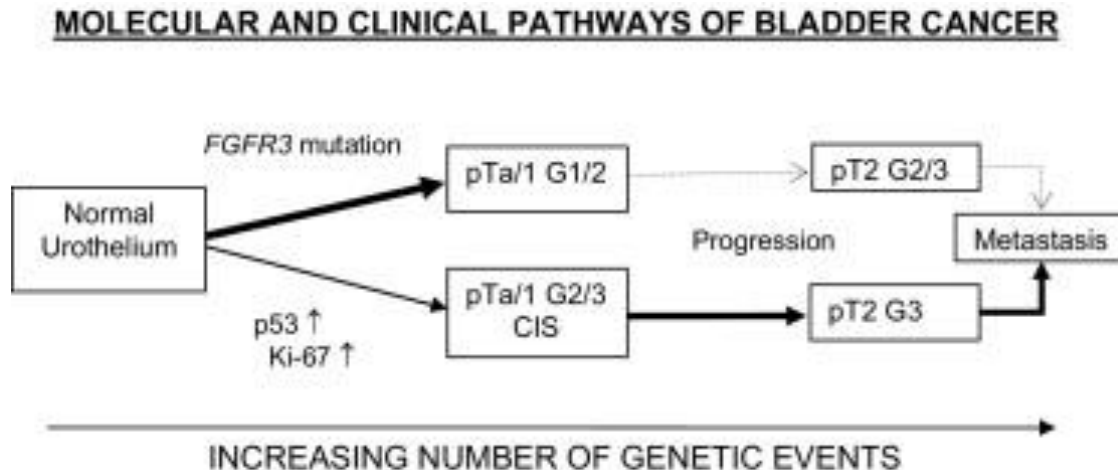

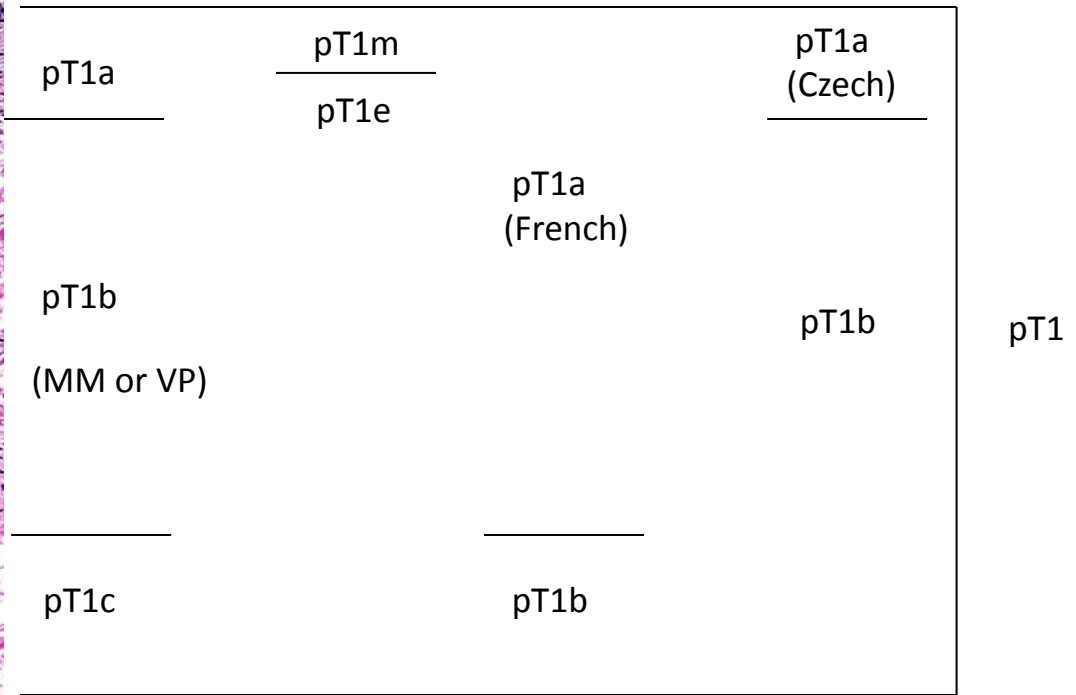

Figure 1: Simplified two-pathway model for disease pathogenesis of BC. This figure shows the combination of molecular and pathologic data in non-muscle-invasive BC. Arrow thickness is indicative for the percentage of tumors. The *FGFR3* mutation is largely responsible for the favorable molecular pathway in NMI-BC. Among many others, P53 and Ki-67 overexpression are examples of unfavorable NMI-BC. Molecular alterations, not included in the figure in the interest of clarity, are represented by the bottom arrow. *FGFR3* = fibroblast growth factor receptor 3 gene; mt = mutation; ↑ = elevated expression (Ki-67, p53); CIS = carcinoma in situ.

Staging the depth of invasion in the lamina propria

Muscularis mucosa and/or muscular vessels are present in only 50% of TUR specimens

Subclassification relative to MM – different schema with overlapping terminology

- Microinvasive (≤ 0.5 mm vs > 0.5 mm; pT1e versus pT1m)
- Above, within and below the muscularis muscose (pT1a, pT1b, pT1c)
- Above and into the MM versus below (pT1a, pT1b)
- Actual depth of invasion using micrometer (basement membrane to deepest tumor)
- Greatest dimension of invasive focus
- # fragments with invasion (also unifocal versus multifocal)

CARCINOMA OF THE BLADDER

Tumor Stage vs Progression

Progression per 100 person/year

Example of pT1e/pT1m

Bladder Cancer

A New and Highly Prognostic System to Discern T1 Bladder Cancer Substage

Bas W.G. van Rhijn^{a,b,*}, Theo H. van der Kwast^{c,d}, Sultan S. Alkhateeb^a, Neil E. Fleshner^a, Geert J.L.H. van Leenders^d, Peter J. Bostrom^a, Madelon N.M. van der Aa^b, David M. Kakiashvili^a, Chris H. Bangma^b, Michael A.S. Jewett^a, Alexandre R. Zlotta^{a,e}

- ≤ 0.5 mm single focus (pT1m) versus > 0.5 mm or multifocal (pT1e)
- Doesn't need MM/VP landmark
- Showed pT1m/e significant for PFS and DSS but not the pT1a/b/c system

Fig. 1 – Examples of T1m and T1e substaging. (a) T1m: a single focus of lamina propria invasion ≤ 0.5 mm (within one high-power field, objective $\times 40$); (b) T1e: specimens showing a >0.5 -mm lamina propria invasion or multiple microinvasive areas. In this example, the lamina propria invasion is >0.5 mm.

Outcomes

Urological Oncology

Prognostic Significance of Substaging according to the Depth of Lamina Propria Invasion in Primary T1 Transitional Cell Carcinoma of the Bladder

Ji Yong Lee^a, Hee Jae Joo^{1*}, Dae Sung Cho², Sun Il Kim, Hyun Soo Ahn, Se Joong Kim

Departments of Urology and ¹Pathology, Ajou University School of Medicine, Suwon, ²Department of Urology, Bundang Jeonang Hospital, Seongnam, Korea

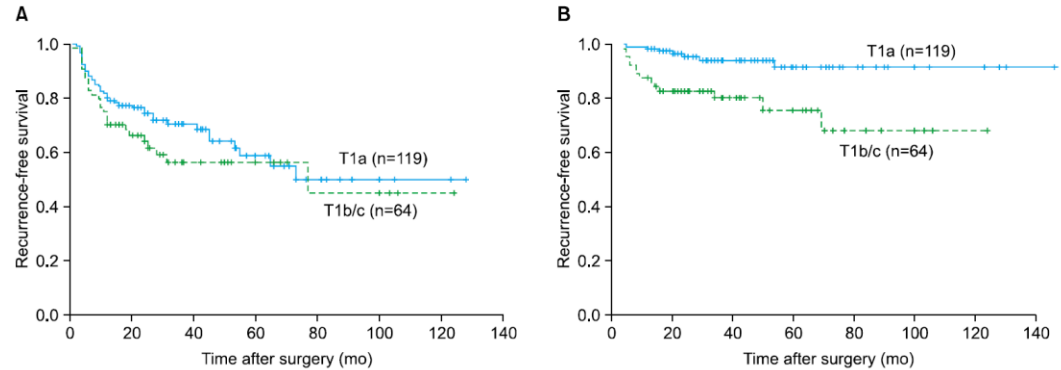

FIG. 2. Kaplan-Meier estimates of recurrence-free (A) and progression-free (B) survival according to the depth of lamina propria invasion in primary T1 transitional cell carcinoma (TCC) of the bladder. Whereas the recurrence-free interval was similar for both groups, the progression-free interval was significantly shorter in patients with T1b/c compared with T1a tumors.

original contribution

Prognostic factors in T1 bladder urothelial carcinoma: the value of recording millimetric depth of invasion, diameter of invasive carcinoma, and muscularis mucosa invasion

Fadi Brimo MD^{a,*}, Chenbo Wu^a, Nebras Zeizafoun MD^b, Simon Tanguay MD^c, Armen Adrikian MD^c, Jose Joao Mansure PhD^c, Wassim Kassouf MD^c

Prognostic pathologic variables in pT1 urothelial carcinoma

99

Variable	Univariate analysis			Multivariate analysis		
	Hazard ratio	95% CI	P	Hazard ratio	95% CI	P
Maximum tumor depth (mm)	2.94	1.86-4.66	.0001	3.58	1.87-6.85	.0001

Abbreviation: CI, confidence interval.

Recommendation

*8th ed AJCC and 4th ed WHO

- Try to substage the lamina propria
- Best system may be to substage pT1 as
 - above MM (would also include microinvasive disease)
 - involving MM and beyond
 - Is invasion multifocal?
 - Is invasion extensive?

Thank you!
